

Site for Analytics news \rightarrow AnalyticsIndiaMag

R \rightarrow Programming Language

RStudio \rightarrow IDE (Integrated Development environment)

Create a project \rightarrow Anything you do gets saved in one place
 \hookrightarrow File \rightarrow New project \rightarrow new directory \rightarrow new project \rightarrow directory name

helps in commenting

$\xrightarrow{\quad}$ Reading right to left.
 $(a) = 5$
 \downarrow
variable/object

Command line Execution \rightarrow Each & Every line can be executed separately

Declare Variable \rightarrow

Function writing :

```
Variable = function(x, y) {  
  result = x * y  
  print(result)  
}
```

Multiplic (4,6)

Result = 24

Data Types : \rightarrow (Nominal, ordinal, Interval & ratio) \rightarrow Stats

for system data types \rightarrow (Numeric, character, logical, Date, vector)

Numeric $\left\{ \begin{array}{l} \text{Integer (whole Number) (1, 2, 3, \dots)} \\ \text{Float (Decimal) (1.2, 3.2, \dots)} \end{array} \right.$

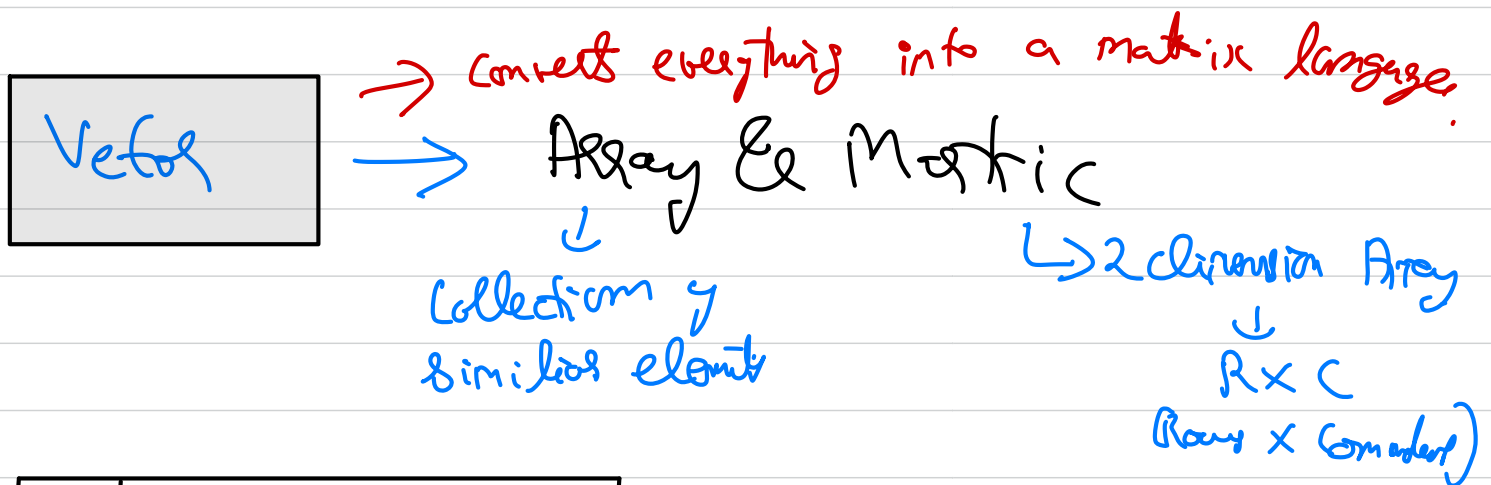

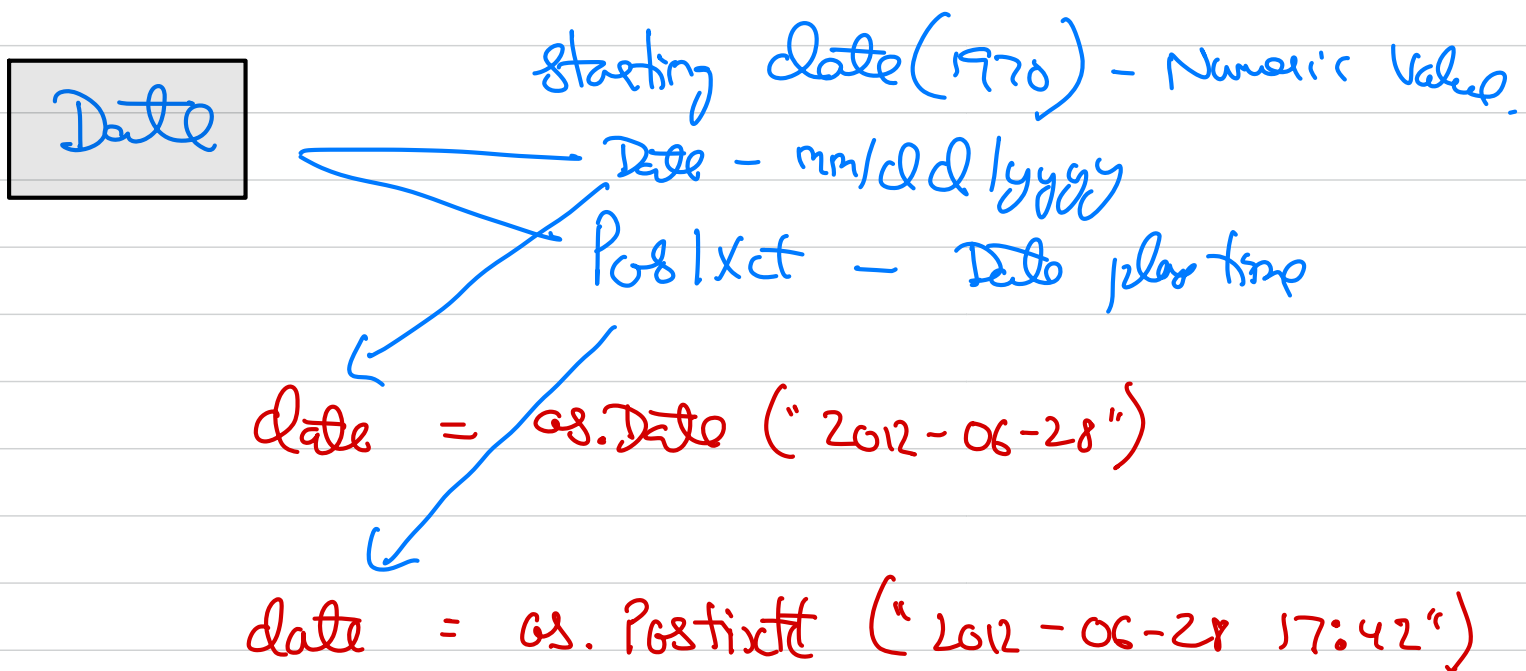

for specifying Integer numeric add L as suffix.

$a = (5L) \rightarrow \text{Integer}$

Character $\left\{ \begin{array}{l} \text{words/strings (Nominal)} \\ \text{Classification (Gender - Male, female) (Ordinal)} \end{array} \right.$
level of classification

Level of classification - factor \dots - Interval level

Example \rightarrow Education Qualification \rightarrow 10th, 12th, Graduate,
Post Graduate (4 levels)

	v_1	v_2	v_3
1			
2			
3			
4			

$V = c(1, 2, 3, 4, 5)$

$S = V * 2$

S

Result 2 4 6 8 10

A vector is collection of elements all of same type.
A vector cannot be of mixed type.

Vector Operation. (+, -, *, /)

Vector data should be of one type

R is also known as vectorised language

Vector - $a = c(1, 2, 3, 4, 5, 6)$

$a = 1:10 \rightarrow$

colon Command

$b = 5:15$

$a+b$

Output = 6 8 10 12 14 - - -

1:10

3:4

output

1 2 3 4 5 6 7 8 9 10
3 4 5 6 7 8 9 10 11 12

4 6 8 7 9 11 10 14 14 13

Smaller vector.
will repeat

$$a = 1:10$$

$$b = 10:20$$

Vector of Character

$a = c("a", "aa", "aaa", "aaaa")$

$nchar(a)$

Subscripting

Accessing "individual elements"

$a = 1:10$

$a[c(1:5, 9)]$

Subscripting
big bracket -

Output = 1 2 3 4 5 9

Naming vectors (Dictionary).

$c(one = "a", two = "y", last = "r")$

String

Factor :

$q = c("a", "aa", "aaa", "aaaa")$

$q_2 = c(q, "aa", "aaaa") \rightarrow$ To add into vector use vector and add element to vector

$q_2 = as.factor(q_2)$

Missing Value :

NA \rightarrow Missing value

NULL \rightarrow Absence of anything. It is not exactly missing, but nothingness.

Data structures - How a language store data

(1) Vector - Already discussed.

(2) Data frames \rightarrow Excel Spreadsheet \rightarrow Combination of different vectors

	v_1	v_2	v_3
v_1			
v_2			
v_3			
v_4			

$R \times C$

③ Matrix \rightarrow Involves Vector as well as Data frames. \rightarrow 2 dimensions only.

④ Arrays \rightarrow Array is a dimensional data set
In a way Matrix is a subset of Array.

⑤ List \rightarrow It can store different type of data even a vector, other list ect.

Data frames:

Creating a data frame:

$X = 10:1$ (vector 1)

$Y = -4:5$ (vector 2)

$g = c('a', 'aa', 'aaa')$ (vector 3)

$theDF = \text{data.frame}(X, Y, g)$

$\text{Str}(theDF)$ \rightarrow Structure.
 $g = \text{as.factor}(g)$

Variable Names

\rightarrow Column names

$theDF = \text{data.frame}(\text{First} = X, \text{second} = Y, \text{third} = g)$

Row names are default i.e. numbers
1, 2, 3, 4 - - - n

Accessing a specific Column/Row/data

Column \rightarrow DF# Spelt \rightarrow Column. by row.

DF [3, 2] \rightarrow 3rd row & 2nd Column

DF [3, 2:3] \rightarrow " " Though

in R files of Sir

Matrix

A = matrix(1:10, nrow = 5)

Output

1	6
2	7
3	8
4	9
5	10

Gives multiplication, addition --- operating calculator

$A \% * \% + (B)$ \rightarrow Tricky!

Multiplication like a matrix.

R Markdown

File \rightarrow New file \rightarrow R markdown.

" " \rightarrow save As

\rightarrow
R objects run
in markdown can
be stored in word
literal & PDF.

How to read data in R.

- Reading Comma Separated Values (CSVs)

data sets in UCI-edu

jseclomedia.com

\rightarrow clean data
real world
data (Not
simulated, not
manipulated)

Getting a variable and give the entire path in the

theURL = "http://www - - - - .CSV"
 tomato = read.table (file = theURL, header = TRUE,
 Sep = ",")
 ↓
 separated by.

first row contain header or not

head(tomato)

Text file > separator (sep) becomes space
 i.e. " " .

R reserved backward slash (\) for specific function but the directory have backward slash so you use double back slash or single forward slash.

read.table (file.choose()) > It lets you select the file
 no need for dirably.

will always have header = "True"

R & Packages :

R \Rightarrow basic functions

R studio \Rightarrow Histogram, Simple linear Regression

\downarrow
Special package

- Install Package
- Load the Package on Working Environment.

\rightarrow from R project.org.

Every package comes with its own dataset to explain the features of the package.

R also have built in data sets,
just type `data()` in R console.

name the data set by
after seeing `data()` in the window
opened.

If the data set contain Null value

`mean(y, na.rm = True)` \Rightarrow Remove the Null
value to find mean

Install - package ("Name").

Heat map \Rightarrow Calculation \rightarrow search on google.

T-test

t.test (column name) \rightarrow check syntax later
